1. Singer/singer

Vertices: singers

Edges: performances

2. Singer/opera

Vertices: singers, operas

Edges: singer to opera connections

(parties performed by the singer in the opera)

3. Singer/role

Vertices: singers, opera roles

Edges: singe to role connections

(the roles played by the singer)

Singer/Singer, Singer/Opera, Singer/Role – giant connected component for corresponding opera graphs

ER – Erdős–Rényi model for random graph,

BA - Barabási–Albert model for preferential attachment graph

V – number of vertices,

E – number of edges

The statistics shows that real *opera graph* are better modelled by *BA* rather than *ER* model. Also the *degree histograms* for opera graph giant connected components (see on following pages) are closer to BA degree histograms in values and shapes (have characteristic hubs) than to ER degree histograms.
